Product Overview

The PUCK-14 is a compact, high-performance 4-in-1 antenna system designed for modern connectivity needs across enterprise, industrial IoT (IIoT), and demanding outdoor environments such as open-pit mining operations. It features 4x4 MIMO Wi-Fi capability, operating seamlessly across tri-bands (2.4 GHz, 5 GHz, and 6 GHz) to ensure compatibility with the latest Wi-Fi standards, including 802.11n, 802.11ac, 802.11ax, and 802.11be. It also includes support for private 5G at 3.3–4.2 GHz, enabling reliable, low-latency communications for mission-critical applications.

Designed for high-efficiency wireless performance, the PUCK-14 integrates four high-performance tri-band antennas with support for both Wi-Fi and private 5G networks. The antenna system provides true omnidirectional coverage to ensure consistent signal strength in all directions, along with pattern diversity to reduce dead zones and mitigate interference. This makes it particularly well suited for IIoT deployments, such as connected sensors, automation systems, and fleet management, as well as open-pit mining environments where wide-area coverage, mobility, and reliability are critical.

The design is optimised to maintain stable throughput and efficient radiation performance, even at higher operating frequencies and in challenging RF conditions. Each antenna supports simultaneous multi-band operation, delivering a peak gain of up to 9 dBi for Wi-Fi and up to 6.5 dBi across the 3.3–4.2 GHz band. Despite its compact size, the PUCK-14 achieves an excellent balance between efficiency, coverage, and connection stability, making it an ideal solution for high-density networks and mission-critical connectivity in industrial IoT and large-scale outdoor environments such as open-pit mining sites.

Antenna Performance Plots

VSWR: Wi-Fi Antenna

Voltage Standing Wave Ratio (VSWR)*

VSWR is a measure of how efficiently radio-frequency power is transmitted from a power source, through a transmission line, into a load. In an ideal system, 100% of the energy is transmitted which corresponds to a VSWR of 1:1.

The PUCK-14 delivers superior performance across all bands with a VSWR of <1.8:1.

**Measured with 2m low loss cable, 650 x 650 mm ground plane, and unused ports terminated with 50Ω load.*

GAIN (Excluding Cable Loss): Wi-Fi Antenna

Gain* in dBi

9 dBi is the peak gain across all bands from 2400 – 2500 MHz, 3300 – 4200 & 5000 – 7200 MHz

Gain @ 2400 – 2500 MHz:	6.5 dBi
Gain @ 3300 – 4200 MHz:	6.5 dBi
Gain @ 5000 – 7200 MHz:	9 dBi

**Antenna gain measured with polarisation aligned standard antenna*

Isolation

Isolation

Isolation is a measure of how much energy from one port leaks into another port undesirably. Isolation of 0 dB between 2 ports means that there are no isolation and the energy from 1 port excitation is visible on another port. Isolation of -30 dB or more means that <0.1% of 1 port's energy is leaked into another. A good isolation is under -10 dB.
